Control Plane (Scheduler)

Cloud computing has become increasingly popular across small, medium and large organizations due to benefits such as cost management, capital efficiency, enhanced productivity, agility, performance and security. It enables you to have access to managed technology services with minimal upfront costs. The burden of infrastructure and application service management is transferred to the service provider so that firms can focus on their core capabilities.
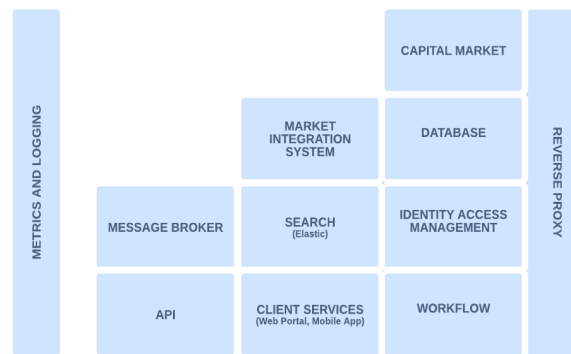

The benefits of incorporating cloud-based applications into your business processes cannot be overstated. According to Multisoft, over 80% of firms that subscribe to business applications delivered over the cloud reported significant operational gains. As shown in a recent Gartner study, application modernization is the most widely cited goal for end-user cloud adoption in banking and investing services. Financial service organizations can leverage the cloud to accelerate value creation for their clients and in the cloud-operating model, your firm subscribes to a fully managed solution from Zanibal. With this model, your firm does not have to deal with the upfront cost of provisioning capacity (Power, Network, Compute, Storage, Redundancy, Human capital).

Our cloud platform enables streamlined execution and management of your critical business processes, and access to real-time analytics and business intelligence, ensuring that you have the data and insight required to drive business decisions. Our suite of solutions delivers outstanding price performance and ensures that all compliance and regulatory requirements for your operations are incorporated into your processes.

Why Zanibal?

The daily increase in the amount of data generated and processed by financial organizations and the need to deliver responsive, secure and reliable financial services to clients, requires the automation of development and production operations used to manage your technology.

Zanibal Cloud Solutions employs the power of Kubernetes, a technology that manages (orchestrates) the many little functions (microservices) used to deliver your business processes. The infrastructure's scheduling and management techniques ensure that capacity and service quality is constantly monitored and proactively managed in response to changes to your workload.

With our cloud solutions, organizations of any size can leverage Zanibal's suite of solutions for CRM, ERP, Workflow, Document Management, Brokerage, Asset Management & Mobile applications to manage their data and provide clients with self-service channels. The platform provides round-the-clock secure access to your applications from any type of connected device, allowing you to grow and scale the business without worrying about your technology.
